ELECTRON TUBE DATA SHEET
WESTERN ELECTRIC 6167 ELECTRON TUBE

DESCRIPTION

The 6167 is a ten-stage cold-cathode gas-discharge stepping tube designed for continuous counting or registration of pulses at rates up to 1000 pulses per second. Each stage consists of a stepping cathode (Bn) followed by an output cathode (Kn). Connections to each output cathode permit obtaining an output signal from each or any stage. A normal (zero) cathode is provided outside the counting ring and operates into the first stepping cathode (B1). The auxiliary anode can be operated to supply an additional output signal when current is carried from K10 cathode. The direction of forward transfer of discharge is in a clockwise direction and the position of the cathode glow may be observed through the top of the envelope.

- Note 1 All data are based on operation of the tube within average current ratings at the time of stepping or transfer of the discharge.
- Note 2 Voltage, with respect to an operating cathode, at which conduction occurs from the auxiliary anode to cathode indicated.
- Note 3 Measured with maximum K10 voltage of +50 volts with respect to the operating cathode.
- Note 4 Voltage, with respect to an operating cathode, applied to the adjacent forward cathode to transfer the discharge to that cathode.
- Note 5 Measured under static conditions. This is an absolute limit on output voltage but as frequency of operation is increased, the available output voltage is decreased because of residual ionization in the preceding cathodes.
