ALPHANUMERIC NIXIE® TUBES

TYPES
B-5971
B-8971
B-7971

The Alphanumeric NIXIE tube has the ability to display all the letters of the alphabet, numerals 0 thru 9 and special characters in a single tube. (See Figure 1).

From the standpoint of both readability and electrical characteristics, the Alphanumeric NIXIE tube provides many unique benefits including: 1) All DC operation; 2) Uniform, continuous line characters of equal height; 3) Memory with simple solid state drive circuits; 4) Readability in high ambient light...200 footlamberts brightness; and 5) Maintenance-free operation...long life with no loss of brightness.

The tube consists of 13 or 15 cathode segments and a common anode. Alphanumeric characters are formed by the application of a negative voltage (with respect to the common anode) to the appropriate combination of cathode segments. The characters appear as a bright "continuous line" red neon glow which can be easily read under high ambient light conditions from distances of 25 to 100 feet and at angles exceeding 150°. The tube's rectangular shape provides maximum read-out density in multi-character displays.

For further information write to Burrhead Corporation, Electronic Components Division, Box 1226, Plainfield, New Jersey 07061.

NOTES

1. These conditions are also recommended for operation. Higher values of supply voltage and series resistor limit the ability of the tube's dynamic impedance to compensate for different numbers (1 to 15) of cathodes being ionized.
2. These tests are conducted with all cathodes ionized as shown in Figure B except as noted (See notes 4 and 5)
3. Under the specified conditions, all cathodes will exhibit uniform glow over their entire surface.
4. Maximum cathode current is measured with the following cathodes energized: B-5971-K₈; B-8971 and B-7971-K₁, K₄ or K₁₅ (all other cathodes floating).
5. Leakage current is measured from one element to all others under the following conditions: Ebb=50Vdc and R_p = 2.5 megohms.
6. Power requirements for the tubes depend to a large extent upon the application; i.e., the maximum number of cathodes required to be ionized at any one time. The graph shown in Fig. 7 gives the normalized anode current as a function of the number of cathodes ionized.
